VIVEKANAND KURANE

Pune, Maharashtra, India | 9767600446 | vivekkurane90@gmail.com | linkedin.com/in/vivekanand-kurane-47732a207

SUMMARY

Software Engineer with 5+ years of experience across full-stack enterprise application development and, most recently, agentic AI platform engineering. Experienced in building production systems with Python/FastAPI, LangGraph-orchestrated LLM pipelines, and Next.js/React, as well as scalable MEAN-stack applications (Angular, Node.js, Express, MongoDB). Proven track record of measurable impact: reduced processing time by 75% on an enterprise mortgage system, led a large-scale Angular v4-to-v14 migration, and closed critical gaps in a production AI pipeline through root-cause debugging and custom tooling. Comfortable owning work end-to-end, from backend services and data pipelines to frontend UI, in Agile, cross-functional teams.

SKILLS

Languages & Core: Python, JavaScript (ES6+), TypeScript, SQL, Java (basic), HTML5, CSS3

Backend & AI/Platform: FastAPI, Node.js, Express.js, LangGraph, LangChain, LangFuse, LLM Integration (Claude/Anthropic API), Retrieval-Augmented Generation (RAG), PostgreSQL, pgvector, RESTful API Development, Microservices Architecture

Frontend: Angular, React, Next.js, RxJS, NgRx, Bootstrap, State Management

Data & DevOps: MongoDB, NoSQL, CI/CD, Git, Agile/Scrum

EXPERIENCE

Software Engineer — Deloitte *June 2026 – Present*

Pune, Maharashtra

- Build and maintain components of SAGE, an agentic AI platform within Deloitte's "Future of Delivery" initiative that converts ERP Business Requirements Documents (BRDs) into live, executed configuration builds for Workday (with Oracle, SAP, and UKG support planned), eliminating manual, consultant-driven field entry.
- Contribute across the stack: Python/FastAPI backend services, a LangGraph-orchestrated Map → Plan → Human Review → Execute pipeline, Postgres/pgvector-backed retrieval, Claude-driven reasoning steps, and a Next.js/React frontend where consultants review and approve generated plans before any change reaches a live tenant.
- Closed critical gaps identified in a BRD code-review pass, including building a missing executor and a custom key-value parser for a tenant-setup object whose source BRD used a non-standard layout, then wired it into the object registry and gating logic end-to-end, backed by new regression tests.
- Root-caused a subtle name-normalization bug causing certain Workday operation names to silently fail allowlist checks despite being correctly registered; resolved it with a targeted alias table rather than a broader rule change, avoiding new edge cases given Workday's inconsistent naming conventions.
- Contributed to a plugin-style architecture spanning dozens of per-object-type packages, enabling new object types to be added without modifying the core pipeline, within a safety model requiring human review and dry-run/canary gates before any production write.

System Engineer — Tata Consultancy Services *December 2021 – June 2026*

Pune, Maharashtra

- Spearheaded the migration of a large-scale web application from Angular 4 to Angular 14, improving performance and maintainability through modern features such as Ivy and strict typing.
- Built in-memory caching mechanisms in Angular to support real-time data updates, significantly reducing data retrieval times.
- Collaborated with cross-functional teams to gather and refine requirements, translating them into technical specifications and a roadmap for future iterations.
- Delivered regular project updates to stakeholders, ensuring on-time completion and adherence to quality standards.
- Engineered data-binding mechanisms and observable patterns using RxJS to support real-time updates, reducing latency and improving user experience.

- Optimized customer-facing interfaces, achieving a 20% reduction in turnaround time and streamlining user workflows.
- Developed and maintained Angular components for customer-facing reporting tools, increasing reporting accuracy by 4%.
- Conducted root-cause analysis on 10+ production issues related to Angular components and services, resolving critical bugs to maintain application stability.

PROJECTS

SAGE — Deloitte *2026 – Present*

Python, FastAPI, LangGraph, Claude/LLM integration, PostgreSQL/pgvector, Next.js, React

- Agentic AI platform converting ERP Business Requirements Documents into executed configuration builds with a human-in-the-loop review and approval gate.

RDD – Renewal Due Diligence — TCS *January 2023 – June 2026*

Angular, Node.js, Express, MongoDB

- Enterprise renewal due-diligence application built on the MEAN stack with real-time data views and optimized API performance.

MMortgage — TCS *December 2021 – December 2022*

Angular, Java Spring Boot

- Designed and developed a mortgage renewal system, streamlining backend workflows and achieving a 75% reduction in processing time through API and data-pipeline optimization.
- Built mortgage selection tools integrating Angular with Java Spring Boot for real-time updates and a seamless user experience.

CERTIFICATIONS

- Claude Associate — Foundational
- Claude Developer — Foundational
- Claude Architect — Foundational
- Associate & Professional Cloud Developer
- MEAN Stack Guide — Angular & NodeJS
- Bootstrap 4
- JavaScript
- GitHub Foundations

EDUCATION

B.Tech, Mechanical Engineering — Sharad Institute of Technology College of Engineering *2021*

Kolhapur, Maharashtra

Diploma, Mechanical Engineering — New Polytechnic Kolhapur *2018*

Kolhapur, Maharashtra

AWARDS

- Outstanding Performance Award — TCS-CIBC: Recognized for delivering a critical, high-impact project under challenging timelines.
- Service & Commitment Award — TCS-CIBC: Honored for consistent performance and long-term contributions across multiple projects.
- On the Spot Award — TCS-CIBC: Recognized for rapid learning, adaptability, and timely delivery on critical assignments.
